'Amino acid sequences of two mouse immunoglobulin lambda chains.";
Proc. Natl. Acad. Sci. U.S.A. 68:590-594(1971)
-!- MISCELLANEOUS: The MOPC 315 cell line produces 2 light chains, 1
normal lambda-2 chain and 1 abnormal lambda-1 chain that is
missing a large part of the V region. The C region sequence (shown here) appears completely normal.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.

Primary structure of the L. chain from a rabbit homogeneous antibody
Primary structure arbohydrate in Sequence determination of peptides
from tryptic and peptic digests.";
J. Biol. Chem. 250:3289-3296(1978).
-!- MISCELLANGOUS: This chain was obtained from antibody to the
specific carbohydrate of group C Streptococci and was isolated
from the serum of a single rabbit.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

-!- MISCELLANEOUS: The sequence shown is the Kern-/Oz-/Mcg- chain found in proteins SH, X, and NIG-64. The Kern protein has the Kern+ marker, the NEWM protein has the Oz+ marker, the Mcg protein has the Kern+ marker, and the Mcg+ marker.

-!- MISCELLANEOUS: Six tandem lambda-type genes were identified and the 3 most 5' were sequenced. These correspond to the Mcg sequence (lambda-1), the Kern-/Oz- sequence (lambda-2) and the Kern-/Oz+ sequence (lambda-3).

"A genomic gene encoding the b5 rabbit immunoglobulin kappa constant region: implications for latent allotype phenomenon.";
Proc. Natl. Acad. Sci. U.S.A. 81:1789-1793 (1984).

-!- MISCELLANEOUS: The cDNA from which this sequence was derived contains a terminator codon within the V-region coding region. The origin of this codon and of the differences between this and other sequenced b5 C regions are unclear. The cDNA clone was made using mRNA from trypanosome-infected b5-homozygous rabbits.

Sequence 44, Application US/08232246A

Patent No. 6329508

GENERAL INFORMATION:
APPLICANT. Friden, Phillip M.
TITLE OF INVENTION: TRANSFERRIN RECEPTOR SPECIFIC
TITLE OF INVENTION: ANTIBODY-NEUROPHARMACEUTICAL OR DI.
TITLE OF INVENTION: CONJUGATES
NUMBER OF SEQUENCES: 46

CORRESPONDENCE ADDRESS:
ADDRESSE: How Militia Drive
CITY: Lexington
STATE: MA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CURRENT APPLICATION DATA:

Patent No. 6015555
GENERAL INFORMATION:
APPLICANT: Friden, Phillip M.
TITLE OF INVENTION: ANTI-BODY-NEUROPHARMACEUTICAL OR DIAGNOSTIC AGENT
TITLE OF INVENTION: CONJUGATES
NUMBER OF SEQUENCES: 46
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C.
STREET: Two Militia Drive
CITY: Lexington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

fusion protein comprising HibbO, a peptide linker, and a human comprising the function region) variant. Also immunoglobulin GFC (fragment crystallisation region) variant. Also included is a carbohydrate-derived cell line producing the human carybropoietin-L-VFC fusion protein cited above in its growth medium in expense of 10 microgramme per million cells in a 24-hour period. The HubbO cevess of 10 microgramme per million cells in a 24-hour period. The HubbO cere in vitro biological activity of at least 2-fold relative to that of recombinant HubbO on a molar basis. The flaxible peptide linker containing about 20 or fewer amino acid mutations to attenuate effector functions. The human igg Fc contains amino acid mutations to attenuate effector functions. The human iggs with human igg with Ser228Pro and Leu235Ala mutations. The Proj31Ser mutation, human igg4 with Ser228Pro and Leu235Ala mutations or cerembinant human erythropoietin-L-VFC fusion protein are useful for treating patients with chronic anaemia caused by renal failure, cancer chemotherapy, rheumatoid arthritis, azathioprine treatment for HIV consolution, or myelodysplastic syndrome. The increased activity and protein in the serum, as compared to prior art, leads to lower dosages and less frequent injections means improved safety and tole-aballity, and less frequent injections means improved safety and tole-aballity, and less frequent injections result in better patient compliance and quality of life. The present sequence represents the fusion protein HUEPO-L-VFCgamma4. invention relates to a recombinant human erythropoietin (HuEPO)-L-vFc recombinant human erythropoietin-L-vFc fusion proteins, useful for treating patients with chronic anemia caused by renal failure, cancer chemotherapy, rheumatoid arthritis, or azathioprine treatment for HIV Claim 4; Fig 2B; 14pp; English. infection

SUN B N C.
SUN C R Y. (SUNE/) (SUNC/) Sun CRY; Sun BNC, Sun LK,

WPI; 2004-634851/61. N-PSDB; ADR48985. New recombinant HuBPO-L-vFc fusion protein comprises human erythropoietin (HuEPO), a peptide linker, and a human IgG Fc variant, useful for treating chronic anemia due to renal diseases, cancer chemotherapy, or rheumatoid arthritis.

Claim 4; SEQ ID NO 20; 31pp; English.

The Recombinant Husevi-Lavyer (Handon protein comprises numan eryturoposetin to the Tecombinant Husevi-Lavyer than a human 1gG Fe variant, is new.

CHUBERNONE CLAIME are also included for the following: a chinese hameter ovary (CHO)-derived cell line producing the Huspo-LavFe fusion protein in the great of the making a recombinant that on the comprising period; and a method for making a recombinant that on order 1s present berein an enth of the making a recombinant that on order 1s present berein. The human 1gG Fe variant comprises a hinge, CH2, and CH3 domains of human 1gG Avariant comprises a hinge, CH2, and CH3 domains of human 1gG Fe variant comprises a hinge, CH2, and CH3 domains of human 1gG Fe variant comprises a hinge, CH2, and CH3 domains of human 1gG With Pro31315es mutations comprising 437 amino acids (SEQ ID NO. 18). It also comprises a hinge, CH2, and CH3 domains of human 1gG with Leu234041, Leu234041, Leu234041, and Pro31315er mutations comprising 437 amino acids (SEQ ID NO. 20). It further comprises a hinge, CH2, and CH3 domains of human 1gG with Leu234041, Leu234041, and Pro31315er mutations comprising 437 amino acids (SEQ ID NO. 20). It further comprises a hinge, CH2, and CH3 domains of human 1gG with Leu234041, and Pro31315er mutations comprising 437 amino acids (SEQ ID NO. 20). It further comprises a hinge, CH2, and CH3 domains of human 1gG Fe contains amino acid mutations to attended the human 1gG Fe contains amino acid mutations to attended the human 1gG Fe contains amino acid mutations to attended the human 1gG Fe contains amino acid mutations to attended the human 1gG Fe contains and a molar basis. Preferred Method Making a recombinant the Law 1900 protein exhibites in vitro obiological activity similar to or higher than the 1gG Fe contains amino acid mutations to attended cell line where the recombinant protein is expressed in exhibite in vitro biological activity similar to or higher than the respect of the off similar protein receins exhibite an vitra part protein or mutation part and and incorporates a BamHI site. The resulting DNA fragments of approximately 600 bp were inserted into a holding vector such as pUC19 at the HindIII and BamHI sites to give the pEPO plasmid. The sequence of the human EPO gene was confirmed by DNA sequencing. For the convenience of cloning, SEQ ID NO. 1 which incorporates a restriction enzyme cleavage site is used as the 5' oligonucleotide primer. The 3' primer (SEQ ID NO. 2) eliminates the EPO termination codon A recombinant HuEPO-L-vFc fusion protein comprises human erythropoietin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A chimeric antibody (AAW14933) comprises the C1 and hinge regions of human IgG2 and the C2 and C3 regions of human IgG4 (G2/G4 MAb) and a murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (WAb) 2A2 heavy chain variable region sequence (see also AAW14932). The chimeric antibody is specific for porcine VCAM. It is useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplantation of porcine cells, tissues and organs into human recipients. The invention describes a recombinant human granulocyte colony-stimulating factor (hG-CSF)-L-vFc fusion protein comprising hG-CSF, a peptide linker, and a human immunoglobulin G (IgG) Fc variant. Also described are: a CHO-derived cell line producing the above hG-CSF-L-vFc fusion protein in its growth medium in excess of 10 kmgr;g per million cited above, comprising generating a CHO-derived cell line cited above, growing the cell line under conditions the recombinant fusion protein is expressed in its growth medium, and purifying the expressed protein. The recombinant fusion protein is useful in treating a variety of conditions associated with an impaired immune or haematopoietic system, including cancer chemotherapy, leukkemias, anaemias, AlDS, bone marrow transplantation, and chronic neutropenias. This is the amino acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A chimeric antibody (AAW14934) comprises the C1 and hinge regions of human IgG2 and the C2 and C3 regions of human IgG4 (G2/G4 MAb) and a murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (NAA) 2A2 heavy chain variable region sequence (see also AAW14932). The chimeric antibody is specific for porcine VCAM. It is useful for diagnosing human rejection of porcine exentransplants and for improving xenotransplants of porcine cells, tissues and organs human recipients. A chimeric antibody (AAW14939) comprises the C1 and hinge regions of human IgG2 and the C2 and C3 regions of human IgG4 (G2/G4 MAb) and a murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (MAb) 3F4 heavy chain variable region sequence (see also AAW14938). The chimeric antibody is specific for porcine VCAM It is useful for diagnosing human rejection of porcine exentransplants and for improving xenotransplants and for human recipients. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  248 APPVA-GPSVFLFPPKPKDTLMISRTPEVTCVVVDVSQEDFEVQENWYVDGVEVHNAKTK 306

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A chimeric antibody (AAW14940) comprises the C1 and hinge regions of human 1gG2 and the C2 and C3 regions of human 1gG4 (G2/G4 MAb) and a murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (MAb) 3F4 heavy chain variable region sequence (see also AAW14938). The chimeric antibody is specific for porcine VCAM. It is useful for diagnosing human rejection of porcine exentransplants and for improving xenotransplantation of porcine cells, tissues and organs human recipients. The present into present the complementary determining region (CDR) are reglaced or fused with biologically active perfides e.g. a peptide minetic such as an erythropoietin (TEPO) or thrombopoietin (TPD) minetic, that is flanked with proline at its carboxy terminus. (I) has minetic such as an erythropoietin (EPO) or thrombopoietin (TPD) minetic, that is flanked with proline at its carboxy terminus. (I) has minetic, antianemic, haemostatic and nephrotropic activities, and can be used as a stimulator of proliferation, differentiation and maturation of haematopoietic cells, and a stimulator of haematopoiesis. (I) is useful corresponding proliferation, differentiation or growth of promegakaryocytes or megakaryocytes, which results in increased platelet promegakaryocytes or megakaryocytes, which results in increased platelet promegakaryocytes or megakaryocytes, which results in increased platelet correct of the CDRs is replaced with a EPO minetic, or which has one or more of its CDRs fused to an EPO minetic, is useful for increasing the production of red blood cells, where (I) is contacted with has one or the appearance of the blood cells, where (I) is one contacted with has mentopoietic stem cells or their progenitors. (I) is useful for diagnostics or therapeutics, in cell isolation strategies, and for treating patients are suffering from deficiency in cell populations caused by disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ij
                                                                                                                                                                                                                                                                                                                                                                                                        comprising a region where amino acid residues corresponding to at least a portion of a two complementarity determining regions (CDRS) are replaced with a peptide mimetic selected from an erythropoietin (BPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the invention has immunosuppressive activity, and may have a use in immunotherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia. The present sequence represents an immunoglobulin antibody heavy chain of
                          immunoglobulin; complementarity determining region; CDR; peptide mimetic; erythropoietin; EPO; thrombopoietin; TPO; immunosuppressive; immunotherapy; thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New immunoglobulin molecule comprising a region, where two complementarity determining regions (CDRs) are replaced with EPO mimetic or a TPO mimetic, useful for treating thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymerase chain reaction, primer; PCR; amplify; murine; pAH4625; heavy; light; chain; variable; constant; region; anti-human; pAH4807; transferrin; receptor; antibody; brain; capillary; pAH4808; gamma-2; endothelial cell; conjugate; neuropharmaccutical; gamma-3; gamma-4; diagnostic; agent; tumour; AIDS; stroke; epilepsy; monoclonal; Parkinsons disease; Alzheimers disease; SP2/0 cell.

The sequences given in AAR41715-18 are encoded by the expression vector pAH4808. This vector represents the cloning of the human gamma isotype, gamma-4, with the variable region of the murine monoclonal antibody 128.1. This plasmid encodes a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences corocity of the combination with the chimeric light chain vector, pAG4611 (see also AQ43845), was transfected into SP2/0 cells and clones were isolated. In combination with the chimeric light chain vector, pAG4611 (see also AQ43845), was transfected into SP2/0 cells and clones were isolated. This an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IgG antibody, light chain; Fc region; effector function; cancer; allergy; asthma; LFA-1-mediated disorder; tumour; cancer.

This invention relates to non-naturally occurring peptide ligands which bind to the human erbB2 gene product ErbB2 (also known as HER2). Peptides crepresented in AAB76320 - AAB76421 - AAB76509 are examples of the ErbB2 binding ligands of the invention. Sequences AAB76421 - AAB76431 represent antibody Fc amino acid sequences used in the isolation of the peptides of the invention. The peptides compete for binding ErbB2 with naturally occurring ligands, and may be used to treat disorders characterized by over expression of HER2/ErbB2 such as cancers, diseases of the nervous system, musculature and epithelia, e.g. nervous system champer resulting from trauma, surgery, strokes, ischaemia, infection, metabolic disorders, nutritional deficiency or toxic agents. In Eccion, particular the synthetic peptide ligands may be used to treat Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease and neuropathy associated with diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APEFLGGPSVFLFPPKPKDILMISKTPEVTCVVVDVSQEDPEVQFNWYVDGVEVHNAKTK 61
                                                                                                            Non-naturally occurring peptide ligands which compete for binding human erB2 gene products, useful for treating e.g. Alzheimer's disease, multiple sclerosis and diabetic neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel fusion polypeptides comprising a peptide ligand domain which functions to target hybrid molecule to target cell, and immunoglobulin constant region multimerization domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 APPVAGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSQEDPEVQFNWYVDGVEVHNAKTK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                         AAB07474-78 represent native IgG Fc regions. The proteins are used to produce Fc region-containing polypeptides that have altered effector function as a consequence of one or more amino acid modifications in the Fc region. The variant polypeptides are useful for treating cancer, allergic conditions such as asthma (with an anti-lgE antibody), and LFA-1-mediated disorders. Where the polypeptide binds the HER2 receptor, the disorder preferably is HER2-expressing cancer, e.g. a benign or malignant tumour characterized by overexpression of the HER2 receptor. Such cancers include breast cancer, gauamous cell cancer, small-cell lung cancer, gatomous, cancer, panceratic cancer, glioblastoma, cervical cancer, ovarian cancer, bladder cancer, hepatoma, colon canner, colorectell cancer, endometrial cancer, hepatoma, carcinoma, kidney cancer, liver cancer, prostate cancer, wulval cancer, thyroid cancer, hepatic carcinoma and various types of head and neck
                                                                                                                                                                                                                                   Fc region-containing polypeptides that have altered effector function to one or more amino acid modifications in the Fc region, useful in treatment of cancer and allergic conditions such as asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; erbB2; HER2; cancer; nervous system disease; stroke; ischaemia; metabolic disorder; nutritional deficiency; Alzheimer's disease; Parkinson's disease; epilepsy; multiple sclerosis; Huntington's chorea; Down's syndrome; nerve dedifness; Meniere's disease; diabetic neuropathy.

                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                       ö
                                            The present invention relates to a fusion protein, comprising a peptide ligand and an immunoglobulin (1g) constant region multimerization domain (1b). The hybrid molecules comprising the peptide ligands and their functional derivatives can be used in the same applications as, a peptide ligand can be used. For example the peptide ligand can bind ErbB2. The peptide ligand may bind to and inhibit the activity associated with a particular target molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to an isolated antibody comprising a dimerisation domain and three or more antigen binding sites amino-terminal to the domain. It is cytostatic, antiinflammatory, antibacterial, immunosuppressive, antiallergic, an apoptosis inducer, a vaccine and used in gene therapy. Along with a cytotoxic agent, is useful for treating a disorder e.g. cancer in a mammal, for inducing apoptosis of a cancer cell, and for killing a B cell or a cell which overexpresses or expresses
                                                                                                                                                                                                                                                                      09
                                                                                                                                                                                                                                                                                                     61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel engineered antibody useful in therapeutic applications, contains dimerization domain and three or more antigen binding sites.

an ErbB receptor and for treating benign and malignant tumours, inflammatory, angiogenic and immunological disorders, autoimmune diseases, central nervous system inflammatory disorders. The antibody is also useful for immunodiagnosis of various diseases including cancer, for human therapy in redirected cycotoxicity, and also useful as fibrinolytic agents or vaccine adjuvants, useful as affinity purification agent, in diagnostic assays for detecting the expression of antigen of interest in specific cells, tissue or serum, and useful for blocking an immune response to a foreign antigen. The antigen is internalised faster than a bivalent antibody by a cell expressing an antigen to which the antibodies bind. The antibody comprises three or four heavy chain variable domains which are able to combline with three or four havy chain variable domain polypeptides to form three or four antigen binding sites directed against
                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

About 80-100% of the glycoprotein comprises a mature core carbohydrate structure which lacks fucose attached to the Fc region. The glycoprotein preferably comprises an antibody, and the Fc region is preferably a human 1gG Fc region, especially a human 1gG1, 1gG2, 1gG3 or 1gG4 Fc region. The glycoprotein binds FcgammaRIII with better affinity, or mediates antibody edpendent cell-mediated cytotoxicity more effectively, than the glycoprotein including fucose. The antibody may be chimeric, humanised or human and binds a B-cell surface marker, an ErbB receptor, a tumourassociated antigen or an angiogenic factor, CD20, HRR2, vascular endothelial growth factor, CD40 or prostate stem cell antigen. The composition is useful for treating cancer, autoimmune disease, an inflammatory disorder or infection in a mammal
